

One product for 3 indications!

## The answer

50 ml

### Dermoscent BIO BALM®

REPAIRING AND PROTECTIVE BALM

- ▶ Nourishes
- ▶ Soothes
- ▶ Repairs

**Dry nose & pads, calluses:**  
apply once to several times a day

**Protection/recovery:**  
before and after each outing

#### Product +:

Water resistant

Organic certified ingredients

#### Key ingredients:

SOYBEAN OIL

ESSENTIAL OIL  
OF CAJPUTI

Dermoscent®  
LABORATOIRE

#### A unique brand offer:

- ✓ Based on natural ingredients
- ✓ Easy-to-use products
- ✓ Proven effective
- ✓ Excellent for skin tolerance

Developed by veterinarians, Dermoscent® products help maintain or restore a healthy skin and a shiny coat.

Available in more than 45 countries

## Dermoscent BIO BALM®, only 1 product for 3 indications!

### Dry nose & pads

#### THICKENED & ROUGH SKIN, CRACKS = HYPERKERATOSIS

Hyperkeratosis in dogs is a skin disease which consists of **an excessive production of keratin** (a protein present in skin, hair and claws), especially **on nose and/or on footpads**. It leads to skin **thickening and hardening**. Affected areas may **crack** and become sometimes infected.

#### HOW TO TREAT HYPERKERATOSIS?

**Manage** the underlying cause and **the potential infection** with proper treatments (ex. **antibiotics**)

Increase comfort and esthetics by applying **hydrating and emollient topical care** (to soften the epidermis)

Do

D60

© M.C. Caillergues - M. Catarino

1 application of Dermoscent BIO BALM® per day during 2 months

### Calluses

#### HOW TO SPOT THEM?

A callus is the normal response to repeated pressure on hard surfaces. **Large dog breeds are often affected**, especially on the elbows (pressure point calluses), because of their greater weight. Over time, a **round unsightly wound appears** where the skin has been in contact with the floor or ground. **Hair loss occurs, the skin thickens**, becomes blue-grey with **crusts & even cracks**. Secondary infection should be suspected.

#### WHAT IS THE SOLUTION?

Pressure point calluses grow in size very quickly and local treatment is recommended in order to prevent them from developing or to reduce their size whilst preventing infections. **Dry skin should be softened using skin cares with excellent moisturizing properties.**

1 application of Dermoscent BIO BALM® per day during 3 months

### Pad protection

Your pets' paw pads are naturally resilient. However, they can be subjected to considerable trauma in certain situations.

- 1. Intense or prolonged physical activities:** long walks, canicross/agility, hunting, dog sled races...can cause foot pads to overheat leading to possible small cuts or abrasions.
- 2. In winter, snow** gets stuck in interdigital spaces, forming small yet hard and frozen clumps that lead to localised inflammation (redness). **Ice** causes the formation of potentially painful **cracks or fissures**, sometimes resulting in limping.
- 3. In summer**, with higher temperatures, your animal may suffer damage such as **burns or other injuries to his/her pads** when they come into contact with **hot tarmac or sand**.

#### THE BEST WAY TO AVOID THESE DAMAGES?

Apply a water-resistant balm to **create an impermeable barrier**, to **protect the pads** before walks/activities and **repair them** after.
