

IMMUNO-CHECK G

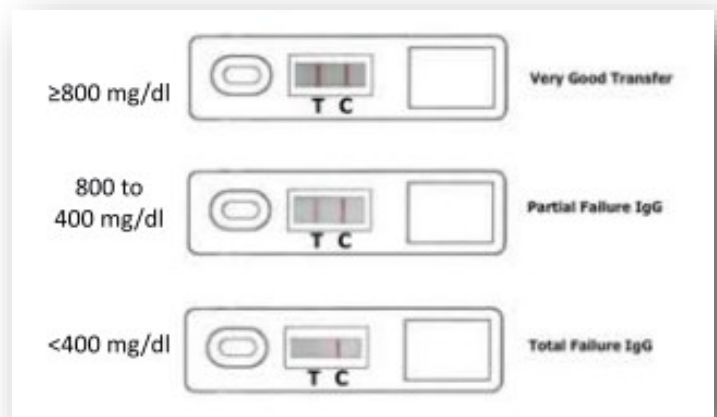

Foal IgG Test Kit

Immuno-Check G is an easy to use lateral flow test for the semi-quantitative detection of immunoglobulin G (IgG) in a single drop of whole blood.

The foal is born with no immunoglobulins (IgG) and must receive adequate antibodies from the mothers colostrum (passive transfer IgG). However, up to 40% of newborns experience a partial or total failure of passive transfer of IgG. This can be caused by premature lactation, deficient suckling, malabsorption or low IgG levels in the colostrum. These animals are at high risk of infection and serious illness or death, so it is vitally important that vets undertake routine measurement of the IgG levels around 12 hours old to determine there isn't failure of transfer of passive immunity (FTPI).

- Room Temperature Storage
- 10 ul Sample size (whole blood)
- 10 min test time
- Kit size is 5 test/kit
